

**MODIFIED CERAMIC FORMULATIONS AND PROCEDURES FOR THE
MANUFACTURE OF CERAMIC PARTS WITH METALLIC EFFECTS AND
CERAMIC PARTS PRODUCED**

5

SUMMARY

10 The aforementioned modified ceramic formulations are conventional
and made from a ceramic mold with an oxide mixture base in different
proportions that have been modified by adding metals, metal mixtures and
non-oxidizing metal alloys with fusion points of greater than 1100° C and
granulometry of less than 100 microns.

15 This procedure consists of the application of the aforementioned
formulations upon the ceramic part to be decorated, followed by the firing
and subsequent grinding.

Its use is for the ceramics industry.
